## Femtolaser and ocular surgery

IT-ARVO Chapter Meeting

**FARMACOLOGIA  
OCULARE**

*Life-changing research*

## L Mastropasqua, L Toto

Catania, 3 Febbraio 2014

# *What patients want from eye surgery?*

- **Safety**
- **Quick visual recovery**
- **Excellent vision without glasses**

# ***Femtosecond laser***

It is an ultrafast laser using a near infrared light to create cuts in ocular tissues

First used in **corneal refractive surgery**  
and **corneal transplant**

Still used today

Recently being used in **cataract surgery**  
Femtosecond laser-assisted cataract surgery (FLCS)

# ***Aim of refractive surgery***

Minimally invasive RS maintaining high quality of vision particularly of high ametropias

**Toward spectacle independence**

# ***Why Femtolaser ?***

***500 KhZ Visumax FSL flap creation in LASIK  
110 microns thickness – 90° rim cut***

# Literature meta-analysis: Efficacy and predictability ↓ with ↑ of the refractive myopic error

Figure 1: Visual outcomes of LASIK for myopia at 3-6 months after surgery

UCVA=uncorrected visual acuity. MRSE=manifest refraction spherical equivalents. For every assessment, results for low myopia with error 0 to -7 D (individual ranges and grouped) compared with high myopia with refractive error -7 D to -12 D.<sup>17-21, 23-25</sup>

## High myopia (conventional laser ablation)

With the larger degree of refractive error and the concomitant need to remove more tissue in higher myopia, this group of patients is often analysed separately when measuring outcomes of refractive surgery. In the high myopia group, FDA data showed manifest refraction spherical equivalent within about 1.00 D of 80% and within about 0.50 D of 61%. Although 89% of patients were 20/40 or better, less than half (48%) achieved 20/20 or better. A loss of best

## Comparison of low to moderate versus high myopia

In general, we might expect less accuracy and larger wound-healing effects with the deeper ablations. As the depth decreases, the cornea might also be destabilised, and this instability can further retard the ability to reach a target refraction. With the FDA data, a comparison of manifest refraction spherical equivalent between low-to-moderate and high myopia after LASIK shows a larger residual refractive error in high myopia. The difference between the low-to-moderate myopia of 96% within about 1.00 D and high myopia with 80% was even more indicative when accuracy to within manifest refraction spherical equivalent of about 0.50 D was analysed (81% for the lower myopic group and 61% for the higher myopic group).

CLINICAL SCIENCES

## Subbasal Nerve Density and Corneal Sensitivity After Laser In Situ Keratomileusis

Femtosecond Laser vs Mechanical Microkeratome

Sanjay V. Patel, MD; Jay W. McLaren, PhD; Katrina M. Kittleson, BS; William M. Bourne, MD

**Figure 1.** Corneal subbasal nerve density before and after laser in situ keratomileusis (LASIK). Subbasal nerve density did not differ between femtosecond laser (bladeless) and mechanical microkeratome treatments at any examination before or after LASIK. For both treatments, subbasal nerve density was decreased at 1 month after LASIK ( $P < .001$ ) and remained decreased through 12 months ( $P < .001$ ). At 36 months, subbasal nerve density did not differ from the preoperative density for either treatment; minimum detectable differences were  $7081 \mu\text{m}/\text{mm}^2$  and  $7930 \mu\text{m}/\text{mm}^2$  for femtosecond laser and mechanical microkeratome, respectively ( $\alpha = .05/5$ ,  $\beta = .20$ , paired analyses).

Dry eye symptoms incidence is similar in FS and Microkeratome LASIK

J Cataract Refract Surg. 2011  
Golas L, Manche EE.

J Cataract Refract Surg. 2009  
Salomão MQ, Ambrósio R Jr, Wilson SE.

The planar configuration of the femtosecond flap is not associated with faster reinnervation compared with microkeratome flaps

Microcoaxial Torsional Cataract Surgery  
1.8 mm Versus 2.2 mm: Functional and  
Morphological Assessment

*Leonardo Mastropasqua, MD; Lisa Toto, MD; Luca Vecchiarino, MD;  
Marta Di Nicola, PhD; Rodolfo Mastropasqua, MD*

**OSLI 2011**

Mean SIA  $0.60 \pm 0.19$  D in 1.8  
 $0.64 \pm 0.55$  D in 2.2 mm

**Low amount of SIA**

**Predictable value with low variability**

# ***Targets for cataract surgery***

## **Corneal astigmatism**

In cataract surgery candidates, preexisting corneal astigmatism between 0.25 D and 1.25 D is observed in 64.4% and in additional 22.2%, it is of 1.50D or higher.

Hoffman PC JCRS 2010. Ferrer-Blasco JCRS 2009

Astigmatism correction possibly at the same time of cataract surgery or as a separate procedure

**Corneal  
Intraocular**

**Precise and predictable  
Correction**

# ***FLACS results***

**Better** capsulotomy construction

Optimization of ELP  
(SE reduction)

Reduction  
of HOA

**Better** CCI architecture  
Less tunnel trauma

Low SIA

Toric implant  
AK

Correction  
of preop astigmatism

# FLACS and rhexis

FLACS

Manual

Better circularity of the FLACS rhexis  
 More symmetric and complete overlap of the  
 rhexis edge over the IOL optic  
**Better IOL centration**

**Better residual SE**  
 due to better ELP (rhexis geometry)

**Lower HOA : rhexis geometry**
